INTRODUCTION

The purpose of the postgraduate programme «Athens International Master's Programme in Neurosciences» is to provide high quality graduate education at the Master of Sciences (M.Sc.) level in the scientific field of neuroscience.

The postgraduate program of studies leads in the award of a "Postgraduate Specialization degree" in Neurosciences (Master of in Neurosciences) after full and successful completion of studies based on the curriculum.

The "Athens International Master's Programme in Neuroscience" is operated jointly by the:

Department of Biology of the National and Kapodistrian University of Athens
Department of Nursing of the National and Kapodistrian University of Athens
Department of Dentistry of the National and Kapodistrian University of Athens
School of Medicine of the National and Kapodistrian University of Athens
Foundation for Biomedical Research of the Academy of Athens
The National Center for Scientific Research "Demokritos"
The Hellenic Pasteur Institute
The Biomedical Sciences Research Center "Alexander Fleming"
The National Hellenic Research Foundation

CELLULAR AND MOLECULAR NEUROSCIENCE

Coordinators

Dimitra Mangoura, Professor-Investigator A, Biomedical Research Foundation of the Academy of Athens

Zafiroula-Iro Georgoussi, Research Director, National Center for Scientific Research "Demokritos", Athens

Teaching hours and weekly schedule

This is a 1st semester course of about 2.5 weeks that corresponds to 5 ECTS and 39 total hours of lectures including student presentations.

Description

This course is designed to introduce graduate students to major processes, principles, and mechanisms associated with Cellular and Molecular Neurobiology. Therefore the material will range from the mechanistic details of neuronal signaling and cellular function to how such properties utilized during normal brain function and neuropathology or substance abuse. The Course involves a series of overview lectures by leading researchers in the field, a total of fifteen Instructors from Greece and across Europe, and opportunities of presenting primary research or literature review papers by students.

More specifically, this Course will include the following major topics: overview of the neuron as the fundamental unit; cell biology of neurons and glia; ion channels and electrical signaling; synaptic transmission, integration, and chemical systems of the brain; molecular properties of neurotransmitters and their receptors; and sensory systems, from transduction to perception. Students will emerge with a great awareness of how individual nerve cells function, and neurons communicate with other cells, and of the ways that neurotransmission can provide insight into basic scientific questions, all in preparation for students own contributions as neuroscientists and biologists.

Course Overview

This is a comprehensive introductory course in Molecular and Cellular Neuroscience. Basic principles of organization and function of the nervous system will be discussed and frequent reference will be made to pathophysiology of neurological and other disorders.

- General principles of Nervous System
- Synaptic Transmission, Neurotransmitters and their Receptors
- Molecular Aspects of Neuronal Cells

Skills & Learning Outcomes

Upon successful completion of this course, students will be able to know the fundamental principles on:

1. Neural cell biology
2. Synapse formation and neural plasticity
3. Intracellular trafficking and cytoskeleton-related processes

4. Interconnections to form nerve circuits for the passage of electric signals
5. Small molecules coupling to their cognate membrane receptors to regulate intracellular responses and biological outcomes
6. Major intracellular signalling pathways
7. Molecular biology of the sensory systems
8. Energy brain metabolism

Titles of lectures and names of the lecturers

A/A	Cellular and Molecular Neurobiology	Lecturer
1	Overview of the Nervous System	Mimika Mangoura
2	Cell Membrane Structures and Functions	Mimika Mangoura
3	The cytoskeleton of neural cells	Mimika Mangoura
4	Intracellular Trafficking	Mimika Mangoura
5	Axonal transport	Mimika Mangoura
6	Protein synthesis and posttranslational modifications	Mimika Mangoura
	Synaptic Transmission and Signalling	
7	Neurotransmitters, Receptors, G proteins	Iro Georgoussi
8	Effectors, signaling intermediates, drug design	Iro Georgoussi
9	Neurobiology of addiction	Katia Befort, France
10	Neurotransmitters II: Gas neurotransmitters	Charoula Peta-Spiros Efthimiopoulos
11	Phosphoinositides	George Leondaritis
12	Neurotransmitters III: GABA	Haralambos Lambrakakis
12	Neurotransmitters V: Peptide neurotransmitters	Iro Georgoussi
12	Neurotransmitters IV: Acetylcholine	Marios Zouridakis
13	Neurotransmitters V: Glutamate	Kostas Pallikaras
13	Neurotransmitters VI: Catecholamines	Kostas Vekrellis
17	Ca ²⁺ signaling and Homeostasis	Panagiota Papazafiri

NEUROPHYSIOLOGY

Coordinators

Irene Skalióra, Professor of Neuroscience and Cognitive Science, Department of History and Philosophy of Science, National & Kapodistrian University of Athens and Biomedical Research Foundation of the Academy of Athens

Consoulas Christos, Associate Professor of Experimental Physiology, Laboratory of Physiology, Medical School of Athens, National & Kapodistrian University of Athens

Teaching hours and weekly schedule

This is a 1st semester elective course of about 2,5 weeks that corresponds to 5 ECTs and 39 total hours of lectures including student presentations.

Description:

This 2,5-week course will focus on cellular and molecular neuroscience. It will cover the mechanisms that operate to regulate neuronal excitability, dendritic and synaptic function; plasticity and neural circuits. This is an intensive course focused on cellular neurophysiology. The main aim of the course is to understand the principles of signal generation, modulation and transmission, both at the cell and circuit level.

Learning Resource

Kandel ER, Schwartz JH, Jessell, TM, et al. Principles of Neural Science 5th Edition (2012). McGraw-Hill NY. ISBN 0071390111

Course Overview

- Introduction lecture
- Ion channels
- Membrane potential, Nernst Equation, Goldman Equation
- Electrotonic potential
- Passive membrane properties
- Action potential
- Na⁺, K⁺, and Ca⁺⁺ channels and currents
- Mechanisms of pre-synaptic release
- Synaptic transmission - ligand gated and G-protein synaptic transmission
- Neuromuscular Junction
- CNS synaptic transmission 1- excitation Glutamatergic
- CNS synaptic transmission 2- inhibition - GABAergic and Glycinergic
- CNS synaptic transmission 3- synaptic integration.
- Neural Circuits: methods of recording and analysis
- Modulation of Neural Circuits

DEVELOPMENTAL NEUROSCIENCE

Coordinators

Rebecca Matsas, Research Director, Head of Department of Neurobiology, Hellenic Pasteur Institute

Panagiotis Politis, Principal Investigator, Biomedical Research Foundation, Academy of Athens

Teaching hours and weekly schedule

This is a 1st semester course of about 2.5 weeks that corresponds to 5 ECTS and 39 hours of lectures including student presentations.

Description

This is an intensive 2.5-week course focused on cellular, molecular and biochemical aspects of developmental neurobiology and neuroscience. The courses will include lectures by established researchers with diverse and complementary academic profiles. The main emphasis of the course will be on the complex cellular events and signaling cascades that occur during embryogenesis that lead to generation of the nervous system. Our goal is to provide a systematic introduction to the molecular mechanisms that control cell fate specification, differentiation, and function of neural cells during mammalian brain development. An additional aim is to discuss nervous system plasticity in the adult brain and particularly how the presence of adult neural stem cells may contribute to brain repair strategies. Special attention will be given to describe the key methodological advances and research tools, developed in the last few years, which have changed our view about the formation of the mammalian brain. Therefore, this course will provide a contemporary overview of neural development for post-graduate students with some background in cell biology.

Course Overview

This course aims: a) to introduce participants to the major issues of developmental neuroscience, b) to familiarize students with the wide range of research approaches, tools and methodology currently used to study the development of the mammalian nervous system, c) to discuss the concept of neural stem cells during development and in the adult and d) to encourage students to develop the skills required for a meaningful appreciation of experimental strategies and research articles.

This course will cover recent advances in understanding the molecular and cellular events underlying cell fate specification and differentiation, migration, axon guidance, synapse formation, the critical role of neurotrophic factors, and cell death as a developmental process. Pathologies arising from failures of these processes will be discussed. In particular, the lectures will cover the following general subjects:

- Neural Induction
- Neural tube formation and patterning
- Cortical & Cerebellar Neurogenesis

- Regulatory mechanisms of cell cycle progression/exit
- Neuronal migration and differentiation
- Axon Guidance & Adhesion Molecules
- Trophic factors and programmed cell death during nervous system development
- Synapses: formation, function and plasticity
- Development of neural circuits
- Development of the neuroimmune system
- Gliogenesis, myelination, remyelination
- Neural stem cells, adult neurogenesis & neuroregeneration
- Advanced Methods in Developmental & Regenerative Neurobiology

Titles of lectures and names of the lecturers

A/A	Developmental Neuroscience	Lecturer
1	Neural Induction / Neural tube formation and patterning	Panos Politis
2	Cortical Neurogenesis	Myrto Denaxa
3	Cerebellar Neurogenesis, Adult Neurogenesis, Modeling human brain development and disease "in a dish	Rebecca Matsas
4	Gliogenesis & myelination	Florentia Papastefanaki
5	Axon Guidance & Adhesion Molecules	Maria Gaitanou
6	Development of neural circuits and plasticity	Laskaro Zagoraiou
7	Synapse: formation and function	Nondas Doxakis
8	Development of the neuroimmune system	Era Taoufik
9	Trophic factors and programmed cell death during nervous system development	Giannis Charalampopoulos
10	Advanced methods in developmental & regenerative neurobiology	Myrto Denaxa
11	Environmental and hormonal regulation of neurodevelopment	Giasemi Koutmani
12	Evolutionary perspectives of human cortical development	Christina Kyrousi

GROSS AND MICROSCOPIC ANATOMY OF THE NERVOUS SYSTEM

Coordinators

Maria Panayotacopoulou, Professor of Neurobiology, 1st Psychiatric Clinic, Medical School of the National & Kapodistrian University of Athens

Anastasia Tsingotjidou, Associate Professor of Anatomy, School of Veterinary Medicine, Aristotle University of Thessaloniki

Dimitrios Mytilinaios, MD, PhD, Head of Content @ Kenhub GmbH - Medical Examiner, Medical School of the National & Kapodistrian University of Athens

Teaching hours and weekly schedule

This a 1st semester course of about 2.5 weeks that corresponds to 5 ECTS and 39 total hours of lectures.

Description

This is an intensive three-week course focused on neuroanatomy that includes lectures and laboratory sessions. All material will focus primarily on learning the structure of the nervous system with related focus on function for general neuroscientists. Special attention will be given to chemical neuroanatomy in order to identify and describe the neurotransmitter systems of the brain and their connections. The goal of this intensive course is that students become well versed in the structure and function of the nervous system in health and disease. Hands on laboratory sessions will allow students to learn through direct experience.

Course Overview

Interdisciplinary study of the nervous system, with the overarching theme that nervous system disorders can be understood in terms of neuroanatomical mechanisms. The course covers general principles of the development, connectivity, neurotransmitter and receptor systems, blood supply, central nuclei and tracts of the central nervous system.

- Major topographical features of the brain
- Describe the major anatomical subdivisions and functions of cerebral cortical systems
- Major interrelationships between primary brain structures
- Localize and identify brainstem nuclei
- Localize and identify brainstem tracts
- Localize and identify major somatomotor systems
- Localize and identify major somatosensory systems
- Localize and identify central sensory systems (visual, auditory and vestibular pathways)
- Localize and understand cranial nerves
- Understand and localize hypothalamic subnuclei and autonomic systems
- Understand and localize the limbic system and diencephalon
- Understand and localize the basal ganglia

- Localize and identify the blood supply of the brain, the ventricular system and meninges
- Understand the basic immunohistochemical methodology that permits the localization of neurons on the basis of their neurotransmitter expression
- Understand the basic concept of in situ hybridization for the study of gene expression in chemically identified neurons that permits the molecular investigation of the nervous system in health and disease.

Skills & Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Describe and identify the components of the nervous system and the sensory organs.
2. Identify the structures of the brain, spinal cord and peripheral nervous system.
3. Describe the relationship of the structure of the nervous system to its functions: movement, sensory systems- basic functions of a living organism.
4. Describe and identify the structure and functions of the autonomic nervous system and the cranial nerves.
5. Relate the chemical and molecular anatomy of the nervous system to clinical syndromes and diseases.

Titles of lectures and names of the lecturers

A/A	Gross and Microscopic Anatomy of the Nervous System	Lecturer
1	White matter Tractography	Foteini Christidis
2	Topographic anatomy of the cerebral cortex-functional mapping	D.Mytilineos
3	Functional Neuroanatomy of Cognition	N. Foroglou
4	Structures and Mechanisms of Language	C. Potagas
5	Hypothalamus and the pituitary gland	M. Panayotacopoulou
6	Structure and function of the limbic system	K.Tsamis
7	Brain Stem and Cerebellum	D. Mytilinaios
8	Thalamus	D. Mytilinaios
9	Basal Ganglia	M. Xilouri
10	Spinal Cord and pathways (+ autonomic NS)	A.Tsingotjidou
11	Hearing and balance	E. Anagnostou
12	Chemical and Molecular Neuroanatomy/ Electron Microscopy	M.Panayotacopoulou, M. Chrysanthou
13	Vision and Visual Cortex (+ plasticity)	E. Skaliora
14	Microscopic Anatomy of the Human brain	M. Panayotacopoulou, M.Chrysanthou

RESEARCH TRAINING EXERCISE (Laboratory Rotation)- TECHNICAL COURSES I

Coordinators

Nikos Fyllas, Ph.D., Assistant Professor, Department of Biology, National and Kapodistrian University of Athens

Stamatis Pagakis, Senior Research Scientist, Basic Research Center, Foundation for Biomedical Research of the Academy of Athens

Teaching hours

This is a 1st semester course of about 8 weeks that corresponds to 10 ECTs and 39 total hours of lectures and approximately 320 total hours of laboratory presence/training.

The course is subdivided into the following parts:

- A) Molecular Biology-Omics**
- B) Elements of Bioinformatics (big data bases)**

A) Technical courses II: Molecular Biology-Omics

Description

These series of lectures will provide

- A) an overview of Next Generation Sequencing (NGS) and the most relevant biomedical NGS applications: Targeted sequencing, Whole-exome sequencing, Whole-genome sequencing, RNA-seq (mRNA-seq, smallRNA-seq, etc., approaches to study RNA structure and RNA-protein interactions), approaches to interrogate the composition and structure of chromatin (ChIP-seq, ATAC-seq, chromosome conformation capture techniques, etc.).
- B) an introduction to proteomic methodologies and their application to the study of human diseases.
- C) an introduction of the significance but also the challenges of applying metabolomic analysis in neurophysiology research. The students will be presented with the major changes in the way problems in life sciences are now approached in the context of the systems biology and the omic analyses revolution, focusing on brain research and the field of systems neurophysiology. The multi-step metabolomic analysis will be described and its contribution to the reconstruction of an accurate metabolic physiology map for the brain will be discussed. Experimental and computational protocol standardization challenges that need to be addressed for its vast deployment in neurophysiology research and practice will be described. An example of brain metabolomic analysis in a mouse model will be presented.

- D) Examples of genetic and biochemical approaches to develop agents interfering with protein aggregation. Many neurodegenerative diseases are associated with protein misfolding and protein self-assembly, which lead to the formation of protein oligomers and/or higher-order aggregates with neurotoxic properties. Thus, understanding these pathogenic processes is of fundamental importance for neurobiology. Furthermore, chemical and biological agents interfering with protein aggregation are much sought-after factors in the quest for effective drugs against these conditions.

Course Overview

The course will cover basic principles of NGS technologies, description of the omic analysis revolution and the consequent fundamental changes in the way problems in life sciences are now approached, mass spectrometry and applications involving differential proteomics, identification of post-translational modifications and analysis of protein complexes as well as of metabolomics. Description of the multi-step experimental and computational analysis process that needs to be carefully designed and standardized for its accurate and vast application in neurophysiology research.

Furthermore, biochemical, biophysical and biological assays, which can be utilized for high-throughput screenings of chemical and biological libraries so as to discover modulators of protein aggregation will be described. Furthermore, the design, development and outcomes of recently developed biotechnological platforms for producing chemical libraries with greatly expanded diversities and for identifying chemical rescuers of pathogenic protein misfolding and aggregation in an ultrahigh-throughput fashion will also be covered.

Skills & Learning Outcomes

The objective will be to familiarize students with

1. the principles underlying NGS and the main biomedical applications in which NGS is employed
2. the experimental design of proteomic experiments and current challenges in their application to the study of human diseases
3. the holistic perspective of biological system analysis gained from systems and network biology research and shown the complementary role of the various omic analyses in deciphering the complexity of brain function
4. metabolomic analysis and its various experimental and computational components
5. network reconstruction and how this could contribute to the elucidation of brain metabolic physiology and the reconstruction of the entire brain connectome
6. the experimental and computational challenges that need to be considered for accurate application of metabolomics in brain research
7. state-of-the-art high-throughput approaches for monitoring neurodegeneration-associated protein aggregation and for identifying chemical and biological inhibitors of these processes

8. recently developed biotechnological approaches for the discovery of chemical rescuers of protein misfolding and aggregation with potentially therapeutic effects against major neurodegenerative diseases

Elements of Bioinformatics (big data bases)

Description

This is an intensive two and a half week course focused on computational analysis and robust interpretation of molecular data streams, generated by a broad spectrum of high-throughput experimental technologies, termed as -omics. Overall these technologies revolutionize the landscape of modern biological research, enabling adoption of holistic approaches in the study and modification of biological mechanisms, yet their efficient integration in the discovery cycle entails great challenges, due to their immense complexity. The derivation of the instrumental molecular networks, behind disease emergence and progression, requests the intelligent utilization of powerful, computational strategies, in order to single out of the millions of biological measurements, those pivotal for the disease interrogated. Moreover, it is crucial to prioritize the important cellular events, in order to be able to propose a rational, combinatorial therapeutic approach, targeting these events, with novel combinations of compounds. In this direction, the various pillars of computational analysis that aid efficient and robust integration, analysis and interpretation of high-dimensional, omic data, potentially from multiple layers of dissection (cross-omics) will be examined, as well as the respective experimental technologies they support.

Course Overview

Ultimate goal of this intensive course is that students are gaining familiarization with this broad pool of experimental technologies, under the umbrella of -omics, together with the various sorts of bio-informatic analytical algorithms and workflows, deployed at different stages and for different data-types. In addition, emphasis will be given in the meaningful integration and robust functional interpretation, in terms of the active emergent molecular modules that shape the phenotypic landscape of the biological problem interrogated, as well as the reliable association of molecular with phenotypic markers. The course will review the application of these concepts in the field of epidemiological stratification, pharmacogenomics analysis and personalized medicine.

Topics to be discussed will cover

- Next generation sequencing technologies, providing an introduction coupled by an overview of the main Next Generation sequencing methodologies (Gen-Seq, Exome seq, RNA- Seq, ChIP-Seq, etc), from the point of view of the computational analysis (de-novo / Reference Genome-based Assembly, Filtering, Signal Estimation, Differential Expression, Statistical Selection, Variant Calling)
- Microarray technologies and their processing (background correction, signal estimation, normalization, filtering and statistical selection)

- Bioinformatic methodologies for multi-layered structural and functional characterization of nucleotide and aminoacid sequences (homology based screening, ORF and gene function prediction, taxonomic and phylogenetic analysis, protein domain analysis, machine learning for functional characterization of proteins, regulatory motif analysis, hot-spot prediction, metagenomic screening)
- Translational, integrative bioinformatic analysis of omic datasets, which highlight the critical biological processes implicated in the biological problem interrogated (integrative methodologies, enrichment statistics, ontologies and controlled vocabularies, resampling based correction, gene set analysis, pathway prioritization, pharmacogenomic knowledgebases)
- Target prioritization and diagnostic stratification discussing the methodologies for the inference of small-sized, highly informative signatures for diagnostic classification, pharmacogenomic analysis, combinatorial treatment (semantic networks, interaction networks, network inference and analysis, derivation of molecular signatures, classification and clustering methodologies, machine learning techniques)

Skills & Learning Outcomes

Upon successful completion of this course, students will be able to define, describe and discern critical functional features of:

1. the main Next Generation Sequencing Methodologies and their fundamental computational steps.
2. the current state-of-the-art microarray technologies, popular platform configurations for various omic experimental designs, and the requisite algorithmic processing steps.
3. the main structural bioinformatic algorithmic tools that are available for the analysis and functional characterization of nucleotide and aminoacid sequences.
4. various molecular enrichment, gene set and pathway analysis tools / platforms.
5. Network based methodologies for target prioritization, connectivity with drug-related databases, geometric estimation of complexity (Principal Component Analysis) supervised (machine learning, Linear discriminant analysis, PLS) and unsupervised (clustering) classification of phenotypic categories

NEUROPSYCHOPHARMACOLOGY

Coordinators

Christina Dalla, Assistant Professor of Psychopharmacology, Dept. of Pharmacology, Medical School, NKUA

Nikolaos Kokras, Psychiatrist/Psychopharmacologist, Dept. of Pharmacology, Medical School of Athens, National & Kapodistrian University of Athens

Teaching hours and weekly schedule

This is a 2nd semester elective course of about 2.5 weeks that corresponds to 4 ECTS and 31 total hours of teaching including student presentations.

Description

This is an intensive 2.5-week course focused on neuropsychopharmacology that includes lectures from pharmacologists, clinicians, neuroscientists and other specialties. The course will also accommodate student's presentations on specific neuropsychopharmacological issues, as well as written-exercises on pharmacological experimental design.

The lectures will focus on basic principles of pharmacology (such as pharmacokinetics and pharmacodynamics), information on drug design and discovery, treatment of neuropsychiatric disorders, as well as drug-induced changes in functioning of the nervous system. Additionally, the lecturers will give an overview of the techniques and models used for the study of neuropharmacology, as well as the basics of CNS clinical research, including regulations and statistical principles.

The goal is that students will become accustomed with neuropsychiatric treatment, modelling and research. Ultimately, they will be able to pose relevant neuropsychopharmacological questions and contribute to the design of preclinical and clinical studies.

Course Overview

The course will include lectures on drug design/discovery, as well as principles of neuropsychopharmacology preclinical and clinical studies. Students will have the opportunity to present specific neuropsychopharmacological issues, as well as to perform written-exercises on pharmacological experimental design and analysis.

Most importantly, an interactive approach, with the use of poll-machines, will be used for the teaching of the neuropsychopharmacological basis, study and mechanism of action of:

- Antipsychotics
- Antidepressant drugs and mood stabilizers
- Antiepileptics
- Cognitive enhancers
- Drugs of abuse
- Antiparkinsonian drugs and drugs for the treatment of neurodegenerative diseases
- Neuroimaging ligands

Skills & Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Understand basic pharmacological principles
2. Know about most classes of neuropsychopharmacology drugs
3. Know about adverse effects, drug interactions and genomics of CNS-acting drugs
4. Identify new targets for CNS treatments and pose relevant questions
5. Understand the methods used in preclinical and clinical neuropsychopharmacology
6. Contribute to the design of preclinical and clinical neuropsychopharmacology studies

Titles of lectures and names of lecturers

BEHAVIOURAL NEUROSCIENCE IN ANIMALS

Coordinators

Efthimios Skoulakis, Researcher A, Biomedical Science Research Centre “Alexander Fleming”
Antonios Stamatakis, Associate Professor of Biology-Biology of Behaviour, Faculty of Nursing,
National and Kapodistrian University of Athens

Teaching hours and weekly schedule

This is a 2nd semester elective course of about 2.5 weeks that corresponds to 4 ECTs and 31 total hours of teaching including student presentations.

Description

This course will explore the general themes and important questions in the field of animal behavior including the underlying molecular and cellular mechanisms. Topics will include the underlying genetics of behavior, behavioral development, various forms of learning, decision making, social interaction, sexual and parental behavior. The goal of this course to familiarize students with animal models emulating emotional and cognitive functions of humans.

Course Overview

- Attention & Habituation
- Learning & Memory I: Aplysia-molecular concepts
- Learning & Memory II: Mammals – Hippocampus
- Learning & Memory III: LTP & place cells
- Learning & Memory IV: Adult neurogenesis
- Learning & Memory V: Drosophila
- Learning & Memory VI: Zebra fish
- Emotions and the limbic system
- Motivation and the reward system of the brain
- Prefrontal cortex: Decision making, working memory and monitoring of behavior
- Social Interaction & aggression I-Non mammalian species 12. Social Interaction & aggression II-Mammals
- Sexual behavior
- Maternal/Parental behavior
- Effects of early life experiences on emotion and cognition

Skills & Learning Outcomes

At the end of the course the students will be acquainted with the scientific research on animal behavior and will understand the complexity of the mechanisms controlling behavior.

Goals will be to:

1. Gain knowledge of common biological terms and principles used in the study of animal behaviour
2. Comprehend behavioral terms and principles and demonstrate this comprehension via interpretation of material in lecture

3. Apply studied behavioral terms and principles to new situations
4. Analyze behavioral principles based on the ability to distinguish between facts and inferences
5. Synthesize general principles from different sub-fields of behavior to solve problems using creative thinking
6. Evaluate behavioral principles in a study of the behavioral literature

Titles of lectures and names of the lecturers

A/A	Behavioral Neuroscience in Animals	Lecturer
1	Attention & Habituation	Efthimios Skoulakis
2	Learning & Memory I: Aplysia-molecular concepts	Efthimios Skoulakis
3	Learning & Memory II: Drosophila	Efthimios Skoulakis
4	Learning & Memory III: Drosophila experimental strategies	Efthimios Skoulakis
5	Learning & Memory VI: Mammals –Hippocampus	Irene Skaliora
6	Social Interaction & aggression I-Non mammalian species	Efthimios Skoulakis
7	Social Interaction & aggression II-Mammals	Antonis Stamatakis
8	Sexual behavior Maternal/Parental behavior	Antonis Stamatakis
9	Emotions and the limbic system	Irene Skaliora
10	Motivation and the reward system of the brain	Antonis Stamatakis
11	Prefrontal cortex: Decision making, working memory and monitoring of behavior	Antonis Stamatakis

NEUROIMMUNOLOGY

Coordinators

Ourania Tsitsilonis, MD, Ph.D. Professor, Department of Biology, National & Kapodistrian University of Athens

Vasiliki Kyrargyri, PhD, Researcher C, Department of Immunology, Hellenic Pasteur Institute

Teaching hours and weekly schedule

This is a 2nd semester elective course of about 2.5 weeks that corresponds to 4 ECTS and 31 total hours of teaching including student presentations.

Description

This is an intensive 2.5-week course focused on neuroimmunology that includes lectures and student presentations. All material will focus on learning the interactions between the immune and nervous systems and their relevance to the pathology of diseases, particularly those of the central nervous system (CNS). The course will teach basic principles of immune system function, and evidence for its involvement in nervous system function and dysfunction from the study of experimental disease models and clinical data from patients with autoimmune and neuroinflammatory diseases. The goal is that students become conversant with the extent of immune system involvement in nervous system under physiological and pathophysiological conditions. The course will be interactive, with students actively participating through their own research into, and presentations of, currently developing areas in this field.

Course Overview

The course will combine basic research and clinical experience in the field of neuroimmunology to study the involvement of the innate and adaptive immune systems in the CNS under physiological and pathophysiological conditions. The course covers the general principles of peripheral and CNS immune systems, neuroimmune interactions in health and disease, animal models for the study of autoimmune and neuroinflammatory diseases of the CNS, human neuroimmune diseases and clinical experience with current immunotherapeutics for their treatment.

- Basic principles of the immune system
- Cell migration into the CNS and antigen presentation
- CNS immune system and functions in physiology and disease
- Neurodegeneration and neurorepair
- Animal models- critical appraisal as models for human neuroinflammatory diseases
- Human neuroimmune diseases
- Immunotherapeutic approaches for neurodegenerative diseases

Skills & Learning Outcomes

Upon successful completion of this course, students will:

1. Understand the structure and functions of the peripheral immune system with relevance to neuroimmune interactions.
2. Understand the components and functions of the endogenous CNS immune system.
3. Be able to critically analyse results from experimental models and assess their relevance for human disease.
4. Be conversant with the extent of immune involvement in neurological disease.
5. Be able to appreciate the benefits and limits of current immunotherapeutics, and understand open needs for new therapies, for the treatment of human diseases.

Titles of lectures and the names of lecturers

A/A	Neuroimmunology	Lecturer
	Basic principles of the peripheral immune system	
1	Innate immune system	Ourania Tsitsilonis / Ioannis Kostopoulos
2	Adaptive immune system (B and T cells)	Ourania Tsitsilonis / Ioannis Kostopoulos
	Immune cells and mechanisms relevant for CNS immune responses	
3	Neutrophils and immune mechanisms	Konstantinos Kambas
4	Microglia in health and disease	Konstantinos Kambas
	Blood Brain Barrier and "CNS immune privilege"	
5	Pericytes: functions in health and disease	David Attwell
6	Structure and function of BBB, participation in CNS autoimmunity	Dimitris Kitsos
7	Live imaging T cell interactions with the BBB	Naoto Kawakami
	Mechanisms of neuroinflammatory diseases	
	Immunology for Alzheimer's disease - experimental models of disease	Spiros Georgopoulos
	Models of multiple sclerosis: modeling the contribution of autoimmunity and therapeutic aspects	Anastasia Dagkonaki
8	Autoantibody and B-cell diseases of the CNS	Harry Alexopoulos
	Human autoimmune disease and new technological advances	
9	Human Multiple Sclerosis- clinical aspects	Marina Bosiki
10	New technological advances in neuroimmunology	Lesley Probert
11	Bioinformatics	Artemis Chatzigeorgiou

NEUROBIOLOGICAL BASIS OF DISEASES OF THE NERVOUS SYSTEM

Coordinators

Leonidas Stefanis, Professor of Neurology and Neurobiology, Medical School of Athens, National & Kapodistrian University of Athens

Spiros Efthimiopoulos, Professor of Neurobiology, Department of Biology, Division of Animal & Human Physiology, National & Kapodistrian University of Athens

Teaching hours and weekly schedule

This is a 2nd semester elective course of about 2.5 weeks that corresponds to 4 ECTS and 31 total hours of teaching including student presentations.

Description

This is an intensive 2.5-week course focused on the Genetics, the general processes that operate in several different neurological disorders, the pathology of neurological disorders, their molecular basis, as well as experimental therapeutics. The goal of this intensive course is that students become well versed with the genetic and molecular basis of the disorders of the nervous system.

Course Overview

The course covers general principles that apply to several disorders of the nervous system as well as the description and the pathology and the molecular basis of individual diseases.

General principles include:

- Protein misfolding and aggregation
- protein degradation
- Inflammation
- Neurotoxic and neurotrophic pathways

Examples of the diseases of the nervous system that will be covered include:

- Alzheimer's disease
- Parkinson's disease
- Motor Neuron Disease
- Schizophrenia
- Depression
- Triple repeat disorders
- Epilepsy
- Addiction
- Nervous System Cancers
- Brain and Spinal Cord injury

Skills & Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Understand the common mechanisms involved in various diseases of the nervous system
2. Understand the genetics of neurological diseases
3. Understand and describe the molecular pathways that operate in specific disorders of the nervous system

Titles of lectures and names of lecturers

A/A	Neurobiological Basis of Diseases of the Nervous System:	Lecturer
1	Neurodegenerative diseases as proteinopathies	Kostas Vekrellis
2	Molecular and Cellular Biology of Parkinson's Disease and related synucleinopathies	Leonidas Stefanis
3	Molecular and Cellular Biology of Alzheimer's Disease	Spiros Efthimiopoulos
4	Neurodevelopmental and neuronal migration disorders of the human brain	Christina Kyrousi
5	Protein degradation in neurodegenerative diseases	Maria Xilouri
6	Mechanisms of Addiction	Styliani Vlachou, Alexia Polissidis
7	Brain and Spinal Cord injury	Florentia Papastefanaki
8	Motor Neuron Disease	Laskaro Zagoreou
9	Neuroprotection in neurodegenerative diseases	Dimitris Vassilatis
10	Molecular Basis of taupathies	Katerina Papanikolopoulou
11	Biomarkers of neurodegenerative diseases	Georgios Paraskevas
12	Molecular Basis of taupathies	Katerina Papanikolopoulou
13	The role of the proteasome in aging and age-related diseases	Niki Chondrogianni
14	Triple repeat disorders	George Koutsis
15	Molecular and genetic basis of schizophrenia	Alex Hatzimanolis
16	Biology of Depression	Christina Dalla, Nikolaos Kokras
17	Nervous System Cancers	Mimika Mangoura
18	Mitochondrial function and dysfunction in Alzheimer's disease development and progression	Konstantinos Palikaras
19	Student Presentations	Hardy Rideout-Karadima Georgia

COMPUTATIONAL NEUROSCIENCE

Coordinators

Efstratios K. Kosmidis, Assistant Professor of Neurophysiology, Laboratory of Physiology, Department of Medicine, Aristotle University of Thessaloniki

Vassilis Cutsuridis, Affiliated Researcher, FORTH, Senior Lecturer, School of Computer Science, University of Lincoln, UK

Teaching hours and weekly schedule

This is a 2nd semester elective course of about 2.5 weeks that corresponds to 4 ECTS and 31 total hours of teaching including student presentations.

Description

This course provides an introduction to basic computational methods for understanding what nervous systems do and for determining how they function. We will explore the computational principles governing neural function from the single neuron to the neural network level. Specific topics will cover synaptic plasticity, learning and memory in the brain. We will make use of C++/Matlab/NEURON demonstrations and exercises to gain a deeper understanding of concepts and methods introduced in the course. The course is aimed to students of all ages eager to learn how the brain processes information.

Course Overview

Computational neuroscience is the intersection of neurophysiology, neuroanatomy, mathematical modeling and computer science. Its primary target is to describe how the brain “computes” by simplifying neuronal biology to a set of equations. As most branches of Science, it contains elements of Philosophy and Art. Emphasis will be given on mathematical descriptions and computational techniques used to study and understand neurons and network of neurons. Weekly assignments will allow students to learn through direct experience. The course will provide a glimpse of this exciting field aiming to motivate the young mind by covering the following topics:

- Mathematical modeling in neurophysiology. An introduction.
- Classical, membrane potential theory
- Electrical analogue of the cell membrane – The Lapique model (Leaky Integrate and Fire)
- Action potential theory. The Hodgkin – Huxley model
- Cable theory, multi-compartmental single neuron model
- Models of synaptic transmission (AMPA, NMDA, GABAA, GABAB)
- Models of synaptic plasticity (LTP/LTD, STDP, Hebbian, Delta rule, backpropagation, etc)
- Models of neural networks (feedforward, feedback, competitive, etc)
- Computational tools (NEURON and MATLAB)

Skills & Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Understand and appreciate the integral role of computational techniques and concepts in neuroscience. Study and critique review papers relating the use of computational techniques to the broader development of theories and experimental methods in neuroscience.
2. Understand basic concepts for ion channel and single cell modeling, possibly including:
 - a. I-V curves, the Hodgkin-Huxley model of action potential generation, and simple kinetic models of ion channels, integrate-and-fire approximation
 - b. Mathematical representations of conductances, currents, and their relationship to dynamic changes in nerve cell behavior
3. Use these models and associated methods to predict qualitative functional outcomes or quantitative state changes when varying parameters or changing structural properties of the models.
4. Use one or more software tool that facilitates the calculation of such predictions.

Titles of lectures and names of the lecturers

A/A	Computational Neuroscience	Lecturer
1	Math foundations	Protonotarios Emmanouil
2	Neural data analysis_MATLAB 1&2	Protonotarios Emmanouil
3	Intro to neurophys	Stratos Kosmidis (AUTH)
4	Conductance based neuron models	Stratos Kosmidis
5	Minimal neuron models	Stratos Kosmidis
6	Synaptic models	Vassilis Cutsuridis (UoL)
7	Network models	Vassilis Cutsuridis
8	Synaptic plasticity models	Vassilis Cutsuridis
9	Models of dendrites

RESEARCH TRAINING EXERCISE (LABORATORY ROTATION)- TECHNICAL COURSES II

Coordinators

Stamatis Pagakis, Senior Research Scientist, Basic Research Center, Foundation for Biomedical Research of the Academy of Athens

Dimitra Thomaidou, Senior Investigator, Department of Neurobiology, Hellenic Pasteur Institute

Teaching hours

This is a 1st semester course of about 8 weeks that corresponds to 10 ECTs and 39 total hours of lectures and approximately 320 total hours of laboratory presence/training.

It is subdivided into the following parts:

- A) **Technical Courses III: Methodological approaches in Neuroscience , Microscopy-neuroimaging**
- B) **Technical courses VI: Methodological approaches in Neuroscience , Experimental animal models in Neuroscience**

A) Technical Courses III: Methodological approaches in Neuroscience, Microscopy-neuroimaging

Description

This is an intensive three-week course centered around the study of neuroimaging technologies, that includes lectures, laboratory/hands-on sessions and participation in the acquisition and analysis of neurophysiological/neuroimaging data. All material will focus primarily on learning the different imaging systems and technologies used to study the nervous system, from conventional microscopy to advanced in vivo imaging both in laboratory animals and humans. Attention will be given on learning current digital image processing tools used to analyze/ quantify imaging data. The goal of this intensive course is to provide students with knowledge of novel, state-of-the-art imaging approaches currently used to study nervous system function. Hands on laboratory sessions will allow students to learn through direct experience.

Course Overview

Teaching and some hands-on training of a wide range of imaging tools and technologies currently used to study nervous system morphology, function and dysfunction, both in laboratory animals and humans. The course covers general principles of microscopy (both optical and electron), nuclear and MR imaging, image processing and analysis, as well as advanced neurophysiological and functional neuroimaging approaches linking microscopic analysis with behavior. More specifically, the topics covered include:

HELLENIC REPUBLIC
National and Kapodistrian
University of Athens
Department of Biology

Athens International
Master's Programme
in Neurosciences

- Introduction to human brain function imaging techniques
- Anatomical Neuroimaging
- Live cell dynamics imaging
- FLIM-FRET
- FRAP, in vivo FRAP
- Mechanosensors
- Multiphoton confocal microscopy
- Intravital imaging
- Calcium imaging at whole animal level
- Optogenetics
- Neurophysiology: EEG/MEG
- PET/SPECT Imaging
- fMRI Imaging
- Electron microscopy
- Image Processing (ImageJ, Imaris, Icy)
- Image Data analysis (MATLAB)
- Functional Imaging data preprocessing and analysis (SPM)
- Neurophysiological (EEG/MEG) data preprocessing and analysis (EEGLAB)

Skills & Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Know the basic principles of microscopy and the imaging systems used to study the nervous system.
2. Know the latest applications of imaging technology currently used to answer scientific questions related to nervous structure and function and dynamic cellular interactions.
3. Get in touch with software used for the processing of digital images/videos.
4. Get hands-on training on advanced microscopy and Image Analysis systems currently available in the labs of the participating course instructors.
5. Understand the design of experimental procedures used in neurophysiological (EEG/MEG) and functional neuroimaging (fMRI) experiments to study human cognition
6. Introduction to the preprocessing and analysis software tools used to analyze neurophysiological and functional neuroimaging data used in the labs of participating instructors.

B) Technical courses IV: Methodological approaches in Neuroscience, Experimental animal models in Neuroscience

Description

This is an intensive lecture course focused on popular experimental models used on Neurobiological research. The course aims to explore the main attributes of various experimental systems that makes them suitable to or preferable to address particular types of questions and the depth and generality of answers thus obtained.

Course Overview

Interdisciplinary approach to functional neurobiology and its tools including transgenics, RNA interference, particular usefulness and contributions of selected model systems.

Each system will be examined/presented along the following axes:

1. Usefulness of the model/ contributions
2. Manipulations to make transfectants/transgenics
3. Models/ examples of Neurochemistry
4. Models/ examples of Cognitive and Neurodegenerative diseases.

Models will include

1. Neuronal cells in culture
2. Caenorhabditis elegans
3. Drosophila melanogaster
4. Mouse/Rat

Detailed syllabus

1. Cultured neuron models

Advantages, uses, transfections

Models and examples for Neurochemistry, cultured systems as discovery tools

2. C elegans:

Advantages for Neurobiological research, transgenics, RNAi

Signaling, aging, disease models

3. Drosophila

Advantages for Neurobiological research, transgenics, tools

Neurogenetics, sensory and cognitive models

Cognitive and neurodegenerative disease models, pharmacogenetics

4. Mouse

Advantages for Neurobiological research, transgenics

Cognitive models and methods, neuropharmacology

Neurodegenerative models and applications

Rat models, cognitive and neuropharmacology models

Titles of lectures and names of the lecturers

A/A	TECHNICAL COURSES: Neuro-Imaging, Animal models	Lecturers
-----	---	-----------

1	Animal models of stress and anxiety	Antonis Stamatakis
2	Basic concepts of Behavioral Neuroscience	Irini Skaliora
3	Assessment of cognitive and motor function in rodent models	Alexia Polissidis
4	Human Neuroimaging methods. EEG/MEG, PET/SPECT Imaging	N. Smyrnis
5	fMRI Imaging	N. Smyrnis
6	Light Fluorescence Microscopy: Basic theory and Modern Techniques. Advanced techniques , FLIM-FRET, FRAP	S. Pagakis
7	C-elegans as experimental models in neuroscience	Konstantinos Palikaras
8	The drosophila model for studying neurodevelopment, learning and memory. Drosophila Models for studying cognitive and neurodegenerative diseases	M. Skoulakis
9	IMAGING: In vivo optical animal imaging (fluorescence / luminescence). Advanced imaging techniques- Light Sheet microscopy (SPIM)	V. Kostourou
10	Introduction in experimental models in neuroscience. Rodents as experimental models in neuroscience	Spiros Georgopoulos
11	Image Analysis: Extracting quantitative information from fluorescence microscopy images. Software presentation: NeuroLucida/ImageJ	S. Pagakis
12	Application of FLIM-FRET microscopy	Dimosthenis Mitrossilis
13	IMAGING: Advanced imaging applications in the CNS of living animals: Multiphoton confocal microscopy, Calcium imaging at whole animal level, Optogenetics. Data analysis with Imaris and ICY	D. Thomaidou

RESEARCH THESIS PROJECT

Coordinators

Leonidas Stefanis, Professor of Neurology and Neurobiology, Medical School of Athens, National & Kapodistrian University of Athens

Spiros Efthimiopoulos, Professor of Neurobiology, Department of Biology, Division of Animal & Human Physiology, National & Kapodistrian University of Athens

Duration-ECTs and Sites

This research project corresponds to 58 ECTs. The duration of the Research Thesis Project is at least 11 months and maximum 18 months from its assignment to the student. Extension can only be given in exceptional cases after the student's request and the decision of the Special Interdepartmental Committee (SIC), with the consent of the supervisor.

The execution of the Thesis can be carried out either in domestic Universities and research centers or Universities and Research Institutes abroad, participating or cooperating with the programme. It can also be performed in non-partner Universities or research institutions both foreign and domestic after the decision of the SIC.

The course also includes lectures on Statistical Methods as follows:

Titles of lectures and names of the lecturers

Themes and Topics	Lecturer
Scientific and Statistical Hypotheses, The three paradigms for data analysis: Frequentist, Resampling and Bayesian approach.	Nikos Fyllas
Introduction to R.	Nikos Fyllas
Random Variables, Probability Distributions and Exploratory Data Analysis.	Nikos Fyllas
Comparing means using parametric, non parametric and resampling approaches.	Nikos Fyllas
Correlation and Linear Regression. General Linear Models and Model Simplification I.	Nikos Fyllas
General Linear Models and Model Simplification II.	Nikos Fyllas
An introduction to ML methods	Nikos Fyllas

ETHICS AND NEUROSCIENCE

Coordinators

Effy Vayena, Professor ETH Zurich, Associate Vice President for Digital Transformation & Governance, Chair of Bioethics, Health Ethics and Policy Lab

Jeffrey Kahn, Andreas C Dracopoulos Director, and Levi Professor of Bioethics and Public Policy, Johns Hopkins Berman Institute of Bioethics

Teaching hours and weekly schedule

This is a 4th semester course of approximately 1.5 weeks that corresponds to 2 ECTS and 18 total hours of teaching.

Course Description:

Recent advances in neuroscience have considerably improved our understanding of brain function. However, the study of brain's mysteries often intersects with ethical and public policy concerns. This course aims at presenting and discussing philosophical, societal and scientific perspectives on major bioethical issues pertinent to neuroscience research. Several subjects will be covered, including ethics and brain organoids, ethical issues in animal research in neuroscience, the effects of pharmacological and surgical interventions on the brain/mind, issues of consent for participation in neuroscience research, therapy versus enhancement, brain imaging and mental privacy, neurobiology of decision-making, consciousness, personhood, end-of-life management and death.

Course Overview

The course will present ethical issues in neuroscience research, controversies and arguments regarding neuroscience research involving both animal and human participants and the social implications of neuroscience research.

Titles of lectures and names of the lecturers

A/A	Ethics and Neuroscience	Lecturer
1	The beginning of life and the brain - Moral status of the embryo and path to personhood	Effy Vayena, Jeffrey Kahn, & Marcello Ienca

2	Ethics and brain organoids	Effy Vayena, Jeffrey Kahn, & Marcello Ienca
3	Ethics and neuroscience research involving animals	Effy Vayena, Jeffrey Kahn, & Marcello Ienca
4	Ethics and neuroscience research involving humans	Effy Vayena, Jeffrey Kahn, & Marcello Ienca
5	Ethics and brain-altering drugs	Effy Vayena, Jeffrey Kahn, & Marcello Ienca
6	Informed consent in neuroscience research and applications	Effy Vayena, Jeffrey Kahn, & Marcello Ienca
7	Neuroscience and law	Effy Vayena, Jeffrey Kahn, & Marcello Ienca
8	Personhood, person identity, and the social brain	Effy Vayena, Jeffrey Kahn, & Marcello Ienca
9	Ethics, brain imaging, and mental privacy	Effy Vayena, Jeffrey Kahn, & Marcello Ienca
10	Consciousness, unconsciousness, and death	Effy Vayena, Jeffrey Kahn, & Marcello Ienca
11	Ethics and neurotechnology: implants, brain-machine interfaces, and engineering the brain	Effy Vayena, Jeffrey Kahn, & Marcello Ienca
12	Film - Presentation of an ethics and neuroscience-related movie, followed by discussion	Effy Vayena, Jeffrey Kahn, & Marcello Ienca
